

Appendix C – Prompt log format (Components 2 & 4)

Include a single prompt log file (PDF or DOCX) with entries like the template below.

Date/time	1 may
Tool used	ChatGPT
Goal	What you were trying to achieve
Prompt	I am building a Next.js app for a college assignment and I need to implement a simple machine learning feature (Component 4). I already have: - A Next.js project using the App Router - A Supabase database with a table called "Subjects" - The table has columns like subject_id and subject_name My goal: - Create an in-app ML feature (not separate) - Make a page (e.g. /ml) that fetches data from the Subjects table - Apply a simple "machine learning" logic to group subjects into categories - Display the results in the UI Requirements: - Keep it simple (no heavy ML libraries needed) - Use basic classification (e.g. keyword-based clustering like Programming, Web, AI, Business, Maths) - It must clearly demonstrate: - data input - processing (feature extraction / grouping) - output (clusters shown in UI) I want step-by-step help to: 1. Fetch data from Supabase 2. Create a clustering function 3. Build the /ml page 4. Display results cleanly 5. Explain the ML feature in a human way for a presentation Also help me debug common issues like: - Supabase not returning data - RLS policies blocking access - wrong table names - Next.js page not rendering Guide me like I'm a beginner and keep everything clear and simple.
Model/output summary	The output was what I was looking for. I had to change the page.tsx more times for it properly deploy, I faced issues for the deployment part but with the right data I managed to make it work.
What you changed next	The code, and the database
