

LOG

ROLE: I am a first year in college doing final assignment for nature of enterprise

CONTEXT: We are building a Campus Companion web app for first-year students.

CONSTRAINTS:

- Next.js (App Router), TypeScript
- Serverless backend: Netlify Functions
- Accessibility: WCAG AA principles, keyboard-first
- Data: fictional only (no real personal data)

TASK: I need you to create an app for my final project. I just need a test website for now. but placeholder info on it.

OUTPUT FORMAT: Provide (1) files to create/edit, (2) code only, (3) brief test steps.

SELF-CHECK: After code, list likely accessibility issues and fixes. (4) files to download

This gave me a solid template to work from. I ran it on Netlify and deployed it.

ROLE: I am a first year in college doing final assignment for nature of enterprise

CONTEXT: We are building a Campus Companion web app for first-year students.

CONSTRAINTS:

- Next.js (App Router), TypeScript
- Serverless backend: Netlify Functions
- Accessibility: WCAG AA principles, keyboard-first
- Data: fictional only (no real personal data)

TASK: I need you to take this and make me from scratch a new app to use this one has been failing too much and has wasted too much time

OUTPUT FORMAT: Provide (1) files to create/edit, (2) code only, (3) brief test steps.

SELF-CHECK: After code, list likely accessibility issues and fixes. (4) files to download

I eventually ran into problems building the first draft (as seen on past repos) this gave me the start of the final output. It gave a nice design, and I later tweaked the colour scheme into the final look.

ROLE: I am a first year in college doing final assignment for nature of enterprise

CONTEXT: We are building a Campus Companion web app for first-year students.

CONSTRAINTS:

- Next.js (App Router), TypeScript
- Serverless backend: Netlify Functions
- Accessibility: WCAG AA principles, keyboard-first
- Data: fictional only (no real personal data)

TASK I want to run this natively when I go live it is just a menu help me run it local instead of having to use Netlify. help me enable anything too.

OUTPUT FORMAT: Provide (1) files to create/edit, (2) code only, (3) brief test steps.

SELF-CHECK: After code, list likely accessibility issues and fixes. (4) files to download

I again ran into issues, but this helped dramatically I input the processes listed below.

User email & password

Authenticating the information and matching it to the system user and password

Allow user to login into the system account.

Student timetable

Retrieve timetable information from university system.

Display classes schedule, times, location and exams timetable.

Student profile data such as (name, profile, preferences)

Match the profile information to relevant campus activities and societies.

Display personalized recommendations (ML)

Feedback

System stores and analyses feedback for review

Confirmation message that the feedback has been submitted.

Support request

System storing the request for review.

Display a message that the request has been submitted.

Event applications and attendance

System analyses student's preferences

Recommending related events

Course data & year

Retrieve course information from university system.

Display course information, timetable and exams.

study room booking.

System checks availability and stores booking.

Showing booking confirmation message

Event registration form

Systems save the booking and register the student.

Display confirmation message.

CONTEXT: We are building a Campus Companion web app for first-year students.

CONSTRAINTS:

- Next.js (App Router), TypeScript
- Serverless backend: Netlify Functions
- Accessibility: WCAG AA principles, keyboard-first
- Data: fictional only (no real personal data)

TASK I need you to now remake the app. I want a warm inviting design. make it readable some text was small in boxes. also add a tab for users to change accessibility setting like text size and other changes needed for challenges users may have.

OUTPUT FORMAT: Provide (1) files to create/edit, (2) code only, (3) brief test steps.

SELF-CHECK: After code, list likely accessibility issues and fixes. (4) files to download
